Track Geometry Analysis and Forecasting Software **TRACKLIFE**

ZETA-TECH's *TrackLife* system is an integrated track geometry analysis and forecasting system that generates surfacing and alignment maintenance plans for railway. *TrackLife* calculates time to next surfacing interval for each track segment, and generates an annual forecast of TQI levels, by segment, together with the forecast surfacing cycles. The *TrackLife* program includes Track Quality Indices (TQIs) that allow for the comparison of the condition of the track on a comparative basis. *TrackLife* calculates a surfacing due date for each segment and develops a short, medium, and long term maintenance program.
